Currently, there are mainly two kinds of stock price pattern recognition algorithms: the algorithm based on rule-matching and the algorithm based on template-matching. However, both of the two algorithms highly require the participation of domain experts, as well as their lacks of the learning ability. To solve these problems, the paper proposes a stock price pattern recognition approach based upon the artificial neural network.

Pattern recognition is the process of classifying input data into objects or classes based on key features. There are two classification methods in pattern recognition: supervised and unsupervised classification. Pattern recognition has applications in computer vision, radar processing, speech recognition, and text classification.
